AI Coding Harness Hackathon

Same model. **Different harnesses.**
Your **engineering** makes the difference.

Problem statement

Build an **autonomous coding-agent harness** around the standardized foundation model that can understand software-engineering tasks, navigate an existing repository, intelligently use tools, manage context, orchestrate model interactions, recover from failures, and produce **correct, verified changes** with **efficient use of resources**.

The harness should enable the underlying model to perform software-engineering work with a level of reliability and autonomy approaching modern coding-agent systems.

Participants are free to determine how their harness achieves this objective.

What is a coding harness?

technical-grid

A coding harness is the system surrounding a foundation model that enables it to perform software-engineering tasks autonomously.

Core Responsibilities

- **Orchestration:** Plans work, manages model interactions, and determines when the task is complete.
- **Context:** Finds relevant repository information and manages memory and state.
- **Tools and verification:** Invokes tools, modifies code, runs tests, and verifies changes.
- **Recovery and efficiency:** Detects failures, adapts, and manages token and computational resource usage.

Build the best coding harness you can.

Every team works with the same foundation model, repository, issues, tests, and evaluation conditions. The difference comes from the quality of the harness.

Correctness first.

Evidence over claims.

Efficiency matters.

Same model. Different harnesses.

Your Architecture, Your Choice

No architecture is mandatory.
Build what works reliably.

Build Something Worth Continuing

Results are expected approximately 7-10 days after evaluation, following verification and score consolidation.

Promising repositories may be considered for continued development through LCC × DevClub.

Build a useful, maintainable coding-agent system with potential beyond the event.

Build the harness that turns a foundation model into a capable software engineer.
